Letter No. S121-5-558

National Aeronautics and Space Administration
George C. Marshall Space Flight Center
Huntsville, Alabama

Attention: Mr. J. V. Dunlap, PR-RC

Subject: Transmittal of Technical Progress Report

Reference: Contract NAS8-11662

Gentlemen:

In accordance with the reports requirements of the contract, we attach one (1) reproducible and seven (7) copies of the ~~sixth~~ ^{7th} ~~7th~~ Monthly Technical Progress Report for the Electro-Pneumatic Actuation System.

Very truly yours,

PARKER AIRCRAFT CO.

J. E. Blaney
Project Administrator

PROGRESS REPORT

NASA CONTRACT NAS8-11662

1.0 INTRODUCTION

- 1.1 This is the seventh of the narrative progress reports required by Contract NAS8-11662 calling for the design, development, fabrication, and test of two electro-pneumatic actuation systems per NASA specification 50M35026.

2.0 GENERAL

- 2.1 Component fabrication is approximately 90% complete. Nearly all of the parts for the actuator and servo valve are in-house in an unassembled condition.
- 2.2 The first of the servo valve second stage flexures is through the E. D. M. phase with the slits in. The metering edges are now being ground and will be plated on the ends to establish the operational clearance. The second flexure is following closely.
- 2.3 Small amounts of test fixture adaptors and valve covers are yet to be made.
- 2.4 No work has been done on the gas manifolding and valving in this report period. This is also true of the test panel.

3.0 ANALYTICAL

- 3.1 Analytical work this period was limited to the study of test data for the valve first stage.

4.0 DESIGN

- 4.1 No activity needed or performed other than drawing maintenance.

5.0 MANUFACTURE AND TEST

- 5.1 The two first stage jet pipe and torque motor assemblies have been received, and considerable successful testing has been accomplished as evidenced by the raw data sheets and computations attached.
- 5.2 Testing so far has been performed on one torque motor assembly to insure consistency of data. The following observations are considered of interest.
 - 5.2.1 The first test consisted of dead ended operation of the first stage only, mounted on a test manifold. The attached data sheet and pressure gain curve shows excellent linearity in the operating region and a higher pressure gain than anticipated. The arbitrary null shows that some adjustment of null is needed to make the performance symmetrical, but to insure data consistency the first stage setting as received from the manufacturer will not be disturbed. The torque motor will be properly nulled on the final valve assembly.
 - 5.2.2 Note the reasonable hysteresis evidenced by the cluster of data points.
 - 5.2.3 The manufacturer's test data specs is included with the data for reference.
 - 5.2.4 Several sheets of computations and conversion factors are included to aid in following Parker's interpretation of test results.
 - 5.2.5 Calibration curves of the flowmeters used are included for reference.
 - 5.2.6 The jet pipe flow gain data accumulated using flowmeter 3625 is included but subject to some question because of later observed flowmeter malfunctions.
 - 5.2.7 Further runs made using Parker flowmeter 3626 and plotted on the curve of 1/27/65 are of considerable interest.

5.2.7 (continued)

The most important factor here is evidence that the assumptions made in the computer analysis for jet pipe characteristics have been substantiated.

Other factors of major importance and evidence of potentially good second stage performance as shown by tests are:

- a. Flow from one diaphragm chamber does not materially affect the pressure gain of the other chamber.
- b. For a given setting (input to the torque motor) pressure as a function of servo flow is predictable.
- c. The effect of supply pressure variation on servo pressure and/or flow is also predictable.

6.0 PROBLEM AREAS

- 6.1 There have been no major technical problems uncovered in this report period. The valve nulling and pressure recovery characteristics will be explored more fully and may need some final trimming for optimization. We can operate a system using a torque motor of the demonstrated performance.

Handbook

$$\text{Given } P = \text{constant gauge} = 815 \text{ psi absolute}$$

$$T = -250^\circ F \left(\frac{450}{250} \text{ Rankine} \right)$$

From chart $210^\circ \text{ Rankine} = 117^\circ K$ (See p 74)
plotted on chart

Then for pressure of $\frac{815}{15} = 54.3 \text{ atmospheres}$

$$Z = \frac{PV}{RT} = \approx 1.00 \quad \text{p. 71 of handbook.}$$

From $Z = \frac{PV}{RT} = 1.00 = \frac{(54.3)(V)}{0.6526 \times 117^\circ K}$ p. 69
where $V = FT^3/\#$

$$\frac{(1.00)(0.6526)(117)}{54.3} = V = 1.405 \text{ FT}^3/\#$$

$$@ 3.0 \text{ ft/min} = 3 \times 1.405 = 4.22 \text{ FT}^3/\text{min} @ \begin{cases} 815 \text{ psi absolute} \\ 117^\circ K \end{cases}$$

at standard conditions

$$P = 1.0 \text{ atmosphere}$$

$$V = ? \quad \text{then } 1.00 = \frac{(1.0)(V)}{(0.6526)(289)}$$

$$= 0.6526$$

$$T = 289^\circ K \quad \text{page 2A}$$

$$V = (1.00)(0.6526)(289)$$

$$= 188.3 \text{ FT}^3/\#$$

For 3 ft/min

$$= (188.3)(2.0)$$

$$= 565 \text{ FT}^3/\text{min} = 565$$

$$\text{For } .05 \text{ ft/min}$$

$$= (188.3)(.05)$$

$$= 18.1 \text{ FT}^3/\text{min}$$
